	2.7 Reprint, void, cancel
	2.8 Freight rates, exceptions, approvals
	2.9 Reports and MIS
	2.10 Transporter bills
	2.11 Administration

Part 1 - What was wrong and how to fix it

1.1 The problems in plain words

The full technical list (37 items with steps and screenshots) is in the QA Report. These are the ones that matter for daily work:

	What went wrong	What v1.1 does
HIGH	A Raipur manager could see and approve Bilaspur transporter bills, open other CFAs' import files and change their freight rates.	Each user now only sees and changes records of their own CFA.
HIGH	Typing 'Infinity' or 'NaN' in an amount (or receiving it from an ERP file) was accepted - after that the dashboard and every report showed an error for everyone.	Such values are rejected with 'Not a number'.
HIGH	A damaged or fake Excel file gave '500 Something went wrong'. This happened on your laptop.	You get a clear message: re-save the file as .xlsx or .csv.
HIGH	Very large rate / bill files had no limit and could freeze the system for minutes.	Every upload is limited to 20 MB and 100,000 rows.
HIGH	An importer could change which customer an ERP code belongs to for all future imports.	Changing an existing mapping now needs Masters rights.
MEDIUM	One click on 'Complete' dispatched invoices with no 'Are you sure?'.	Every irreversible button asks for confirmation.
MEDIUM	The dispatch page warned 'date missing / time missing' although they were filled.	Only real problems are listed.
MEDIUM	Bulk 'Complete' looked ready before printing and threw you back to the list when it failed.	It unlocks after you print; you stay on the slip tab.
MEDIUM	Viewers saw invoice links that all said 'Access denied'.	Links only for people who can open them.
MEDIUM	Typing mistakes like 99,999 boxes were accepted as valid.	Such rows are flagged for review.
MEDIUM	A bill could include invoices that were not dispatched by that transporter and still be approved.	Those lines no longer count and block approval until removed.
MEDIUM	Excel exports could turn a malicious customer name into a live formula.	Exported text is always plain text.
LOW	Other polish: queue order, lockout warning, weak passwords, phone layout, labels for screen readers.	All improved - see the QA report.

1.2 Install the fixed version (v1.1) on your laptop

v1.1 changes program files only - your database, uploads and Python environment are kept. No database upgrade is needed. It takes about 3 minutes.

1. Find the black command window where CTDMS is running and press **Ctrl + C** (the app stops).
2. Open **C:\Users\Admin\Downloads\ctdms-v1.0claudeapp**. Right-click the **ctdms** folder › Copy, then Paste - you now have a backup called 'ctdms - Copy'.
3. Right-click **ctdms-v1.1.zip** (sent in the chat, and also saved in your **ctdms_update** folder) › Extract All. Inside you will find a folder called **ctdms**.
4. Open that extracted **ctdms** folder, select everything (Ctrl + A), Copy, then open your original **ctdms** folder and Paste. Choose **Replace the files in the destination**.
5. Double-click **start_demo.bat**. It checks the requirements and starts the app at http://127.0.0.1:8000.
6. Open http://127.0.0.1:8000/health - it should say **"version": "1.1.0"**. Then sign in as usual.

> **Tip:** if anything looks wrong, stop the app (Ctrl + C), delete the ctdms folder, rename 'ctdms - Copy' back to 'ctdms' and start again - you are back on v1.0 with your data.

1.3 5-minute check after updating

1. Sign in with a wrong password once - the message now explains the 5-attempt lock rule.
2. Pending Dispatch: invoices you can work on are at the top; slips show 'printed ×1' or 'not printed yet'.
3. Open a pending invoice: no 'date missing' warning. Verify › Generate slip › Print › Complete Dispatch - a confirmation box appears before completing.
4. Invoice Import: upload any file renamed to .xlsx - you get a readable message, not an error page.
5. Log in as cfa.raipur and open Reconciliation - only Raipur bills are listed.

1.4 If you see this message...

Message	Meaning	What to do
Could not read '...' as a Excel file	The file is damaged, protected or not really Excel.	Open it in Excel › File › Save As › .xlsx (or CSV) › upload again.
File too large (max 20 MB) / Too many rows	Upload limit.	Split the export by date range.
Not a number: 'Infinity' / Number too large	Bad value in the file or form.	Correct the row (Correct row button) or fix it in the ERP export.
... boxes is unusually high / Freight ... % of the sales value	Probably a typing mistake.	Check boxes and sales value; the row can still be imported after checking.
Vehicle number '...' does not look like a registration number	Warning only.	Double-check the truck number (e.g. CG04AB1234). SELF / HAND are accepted.
LR ... is also used on invoice ...	Warning (same transporter).	Fine for a shared consignment; otherwise fix the LR typo.
Invalid username or password. Note: 5 wrong attempts lock the account	Wrong login.	After 5 tries wait 15 minutes, or ask the admin to reset & unlock the user.
Please set a new password before continuing	Admin created / reset your account.	Choose a new password (8+ characters, letters and digits, not a common password).
404 Not found on a bill / import / rate	It belongs to another CFA.	Ask a user with that CFA.
Complete button is grey on the bulk page	Slips not printed yet (control rule).	Click 'Print N slips' first, then Complete.
Reason is mandatory for reprinting (at least 5 characters)	Every reprint is logged.	Type why, e.g. 'Printer jam'.

1.5 Before real use (go-live)

- Use the Docker / server install from docs/DEPLOYMENT.md with PostgreSQL, not the demo laptop setup.
- In .env: **CTDMS_ENVIRONMENT=production**, a random **CTDMS_SECRET_KEY** (the app refuses to start without one), HTTPS and **CTDMS_SESSION_COOKIE_SECURE=true**.
- Start with an empty database; create real users; demo logins are hidden automatically in production.
- Ask your IT person to add login rate-limiting on the web server (protects against account lock-out abuse).
- Load masters and the rate card, get the rates approved by a checker, then do one test import per ERP.

1.6 Resetting the demo data

Testing changed a few demo invoices on your laptop (listed in the QA report). To go back to fresh demo data: stop the app, open a command prompt in the ctdms folder and run:

```
.venv\Scripts\activate
python -m app.cli seed-demo --reset
start_demo.bat
```

This wipes the demo database only. Never run it on a live database.

Part 2 - How to use CTDMS

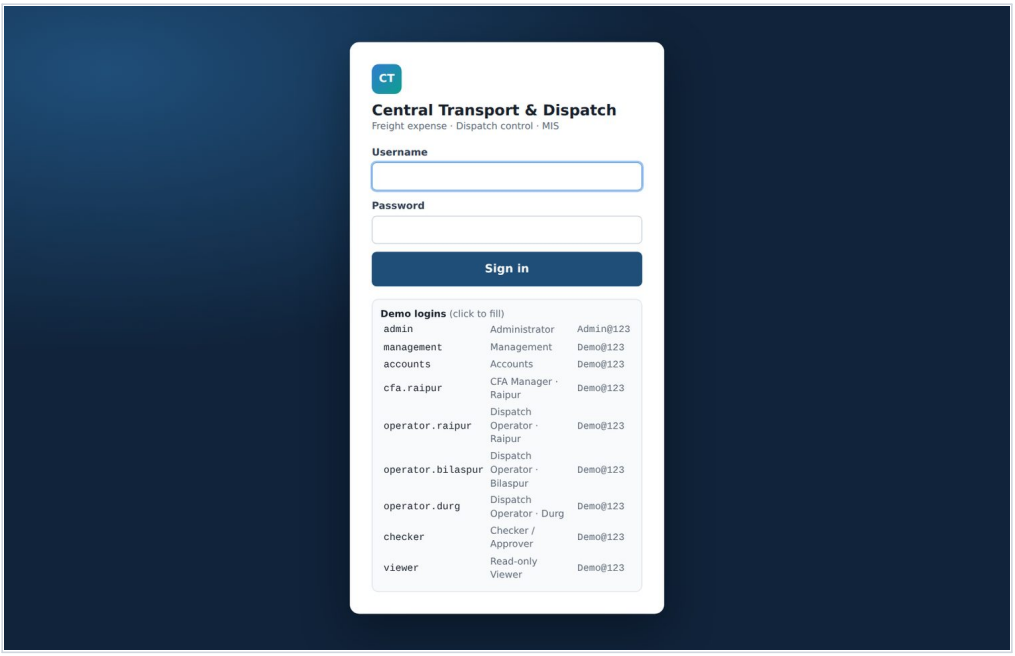

2.1 Roles and logins

Role	Demo login (password Demo@123)	Can do
Administrator	admin / Admin@123	Everything: users, roles, settings, integrations, all data.
Management	management	Dashboard, reports, MIS, exports - all companies and CFAs, read-only.
Accounts	accounts	Transporter bills: enter, reconcile, approve (maker-checker), mark paid.
CFA Manager	cfa.raipur	Own CFA: imports, dispatch, overrides approval, rates proposal, reports.
Dispatch Operator	operator.raipur / .bilaspur / .durg	Own CFA: pending queue, dispatch entry, slip printing, completion.
Checker / Approver	checker	Approves overrides and rates, verifies, voids / cancels.
Read-only Viewer	viewer	Reports only - no exports, no changes.

Each user sees only the companies / CFAs assigned to them. The menu shows only what the role may use.

2.2 Signing in

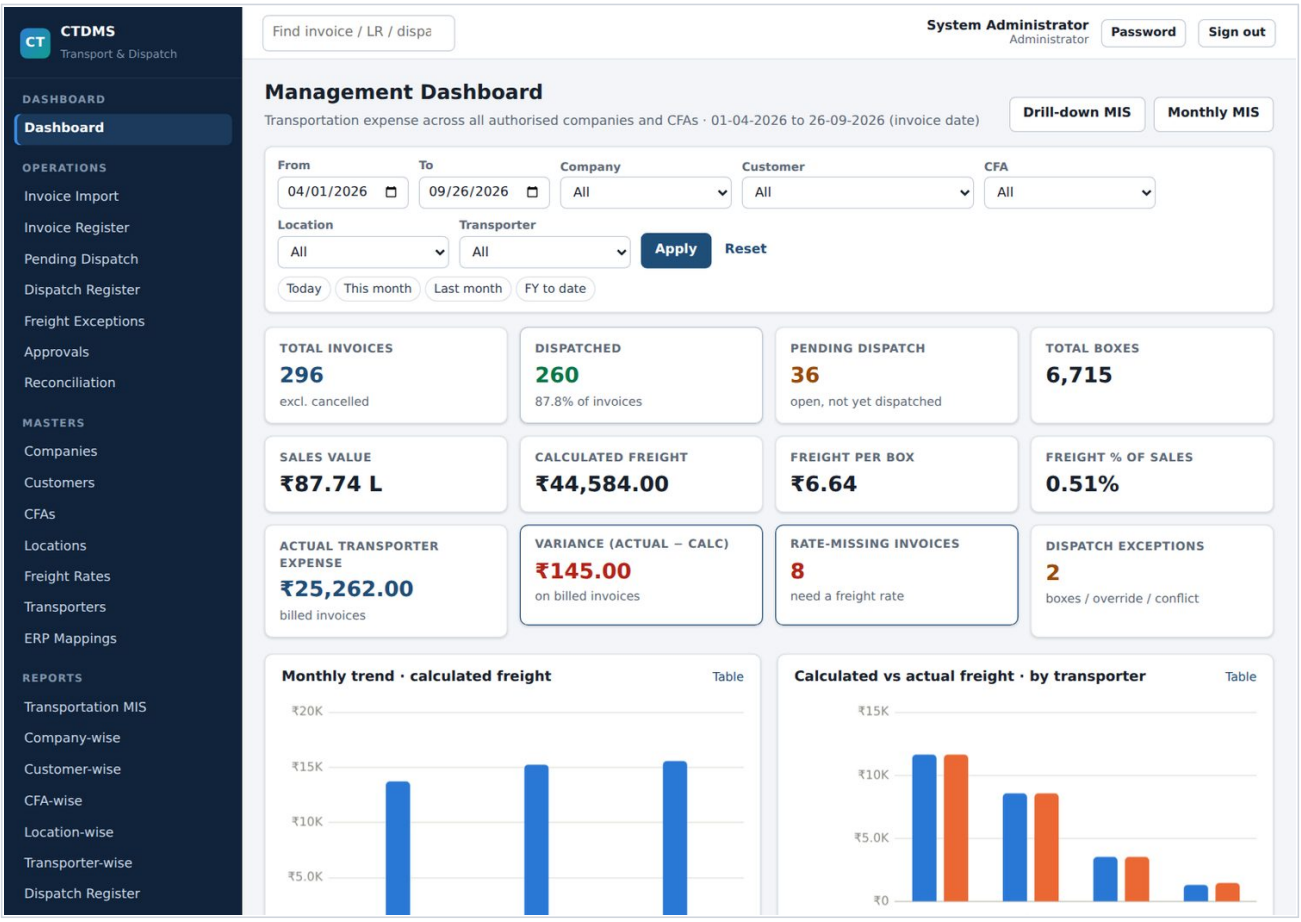

- Open http://127.0.0.1:8000 (laptop) or your server address. Enter username and password, press Enter.
- 5 wrong attempts lock the account for 15 minutes - the admin can unlock it from Administration › Users › Reset & unlock.
- Change your password any time with the **Password** button (top right). New accounts must change it at first login.

Sign-in page (the demo-login list appears only in the demo setup).

2.3 Dashboard

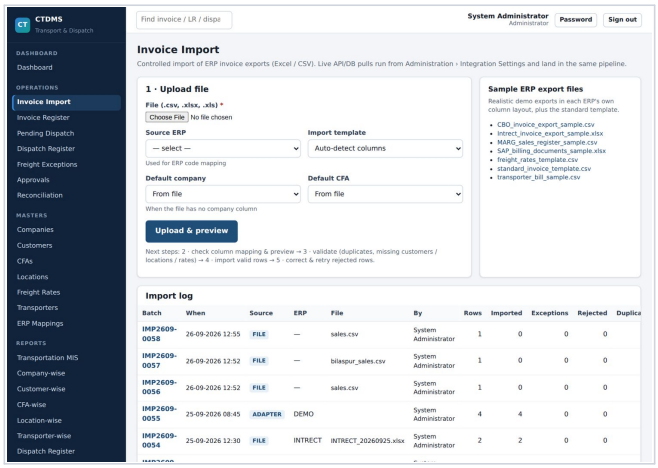

Management view of invoices, dispatches, boxes, sales, calculated vs actual freight, freight per box and % of sales, pending-dispatch ageing and exceptions. Use the date / company / CFA filters at the top; click a tile or chart to drill into the report behind it.

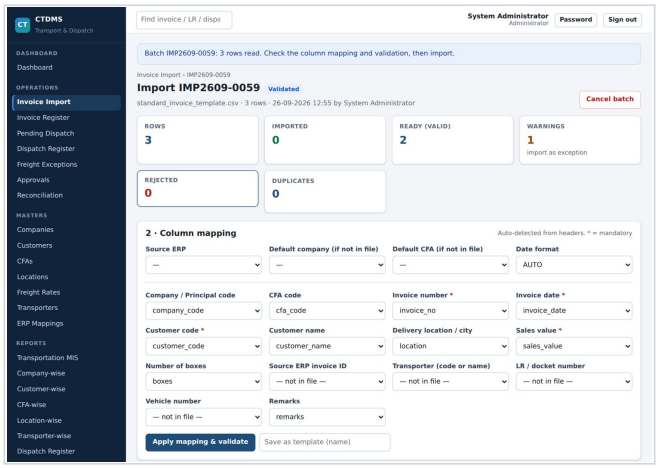

Dashboard (admin).

2.4 Importing invoices

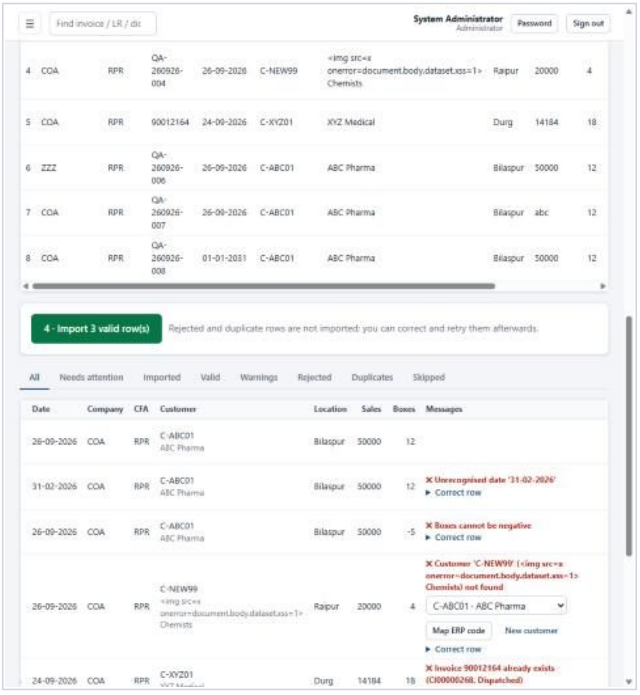

1. **Operations › Invoice Import**. Choose the file (CSV, XLSX or XLS - up to 20 MB). Optionally pick the Source ERP, an import template, and a default company / CFA if the file has no such column.
2. Click **Upload & preview**. Check the column mapping (auto-detected) and click **Apply mapping & validate** if you changed anything. Save it as a template for next time.
3. Read the result tiles: Ready, Warnings (imported as exceptions or flagged for a look), Rejected, Duplicates.
4. Fix rejected rows with **Correct row** › Save & re-validate, or map an unknown ERP customer code with **Map ERP code**.
5. Click **Import N valid row(s)**. Invoices get their freight rate automatically and appear in Pending Dispatch.

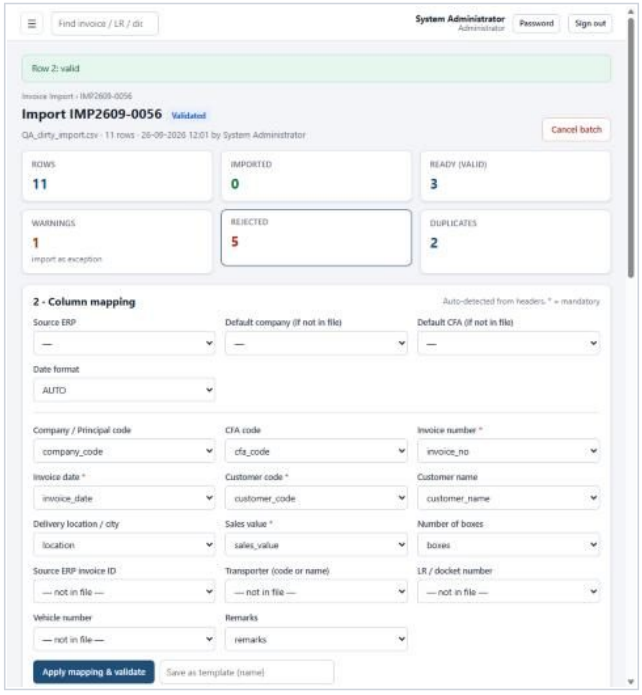

Upload screen

After validation

Validation messages and Correct row (live test on your laptop)

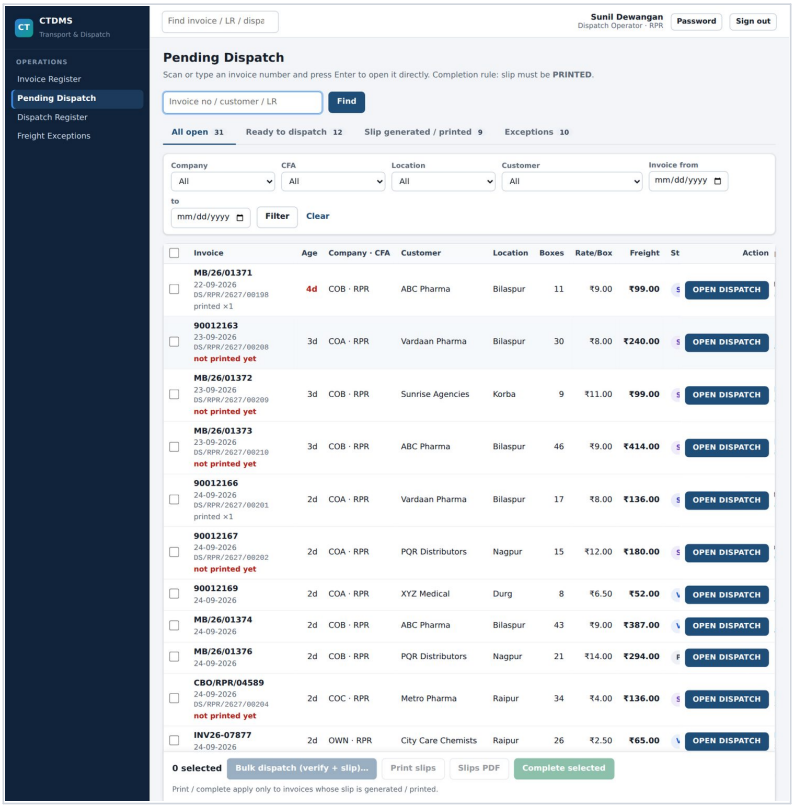

Row fixed and re-validated (live)

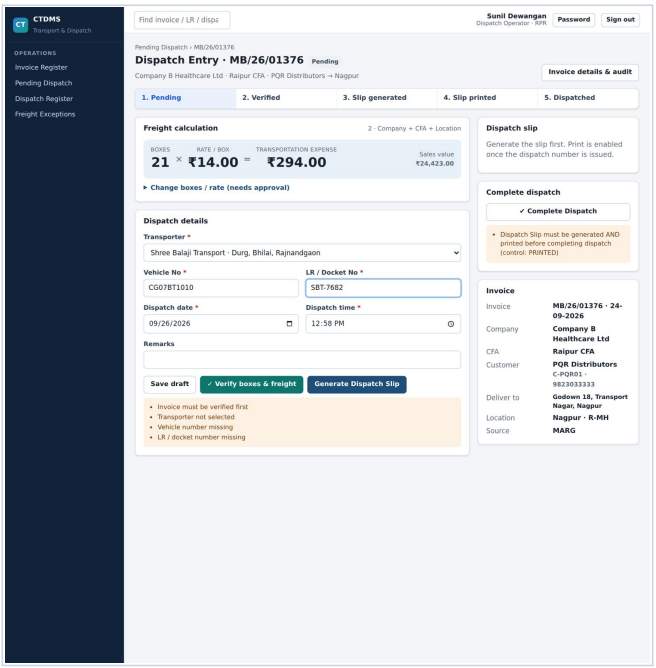

2.5 Daily dispatch (operator)

Rule in this setup: an invoice can be completed only after its Dispatch Slip is generated **and printed** (Administration › System Settings can change this).

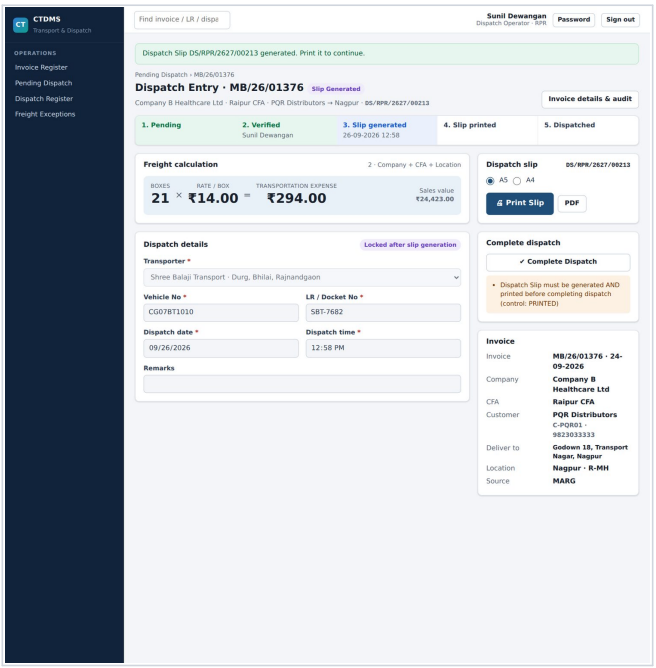

1. **Operations › Pending Dispatch.** Type or scan the invoice number and press Enter (exact match opens it directly), or click **Open dispatch**. Tabs: All open, Ready to dispatch, Slip generated / printed, Exceptions. Invoices blocked by a missing rate are at the bottom.
2. On the dispatch page check boxes × rate = freight. If the box count is wrong use **Change boxes / rate** (goes to a checker for approval).
3. Select the **transporter**, enter **vehicle no** and **LR no**; date and time are pre-filled with now. Click **Verify boxes & freight**.
4. Click **Generate Dispatch Slip** - a dispatch number (DS/CFA/FY/sequence) is issued and the details lock.
5. Choose A5 or A4 and click **Print Slip**. The print page opens and the print is recorded as the ORIGINAL (cancelling the printer dialog still counts - use Reprint with a reason).
6. When the goods leave, click **Complete Dispatch** and confirm. The invoice becomes DISPATCHED.

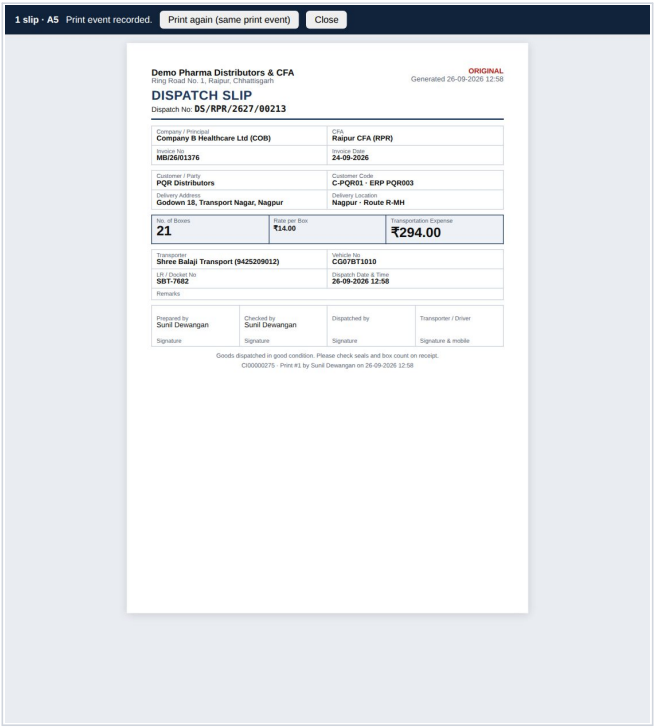

Pending Dispatch queue (operator.raipur).

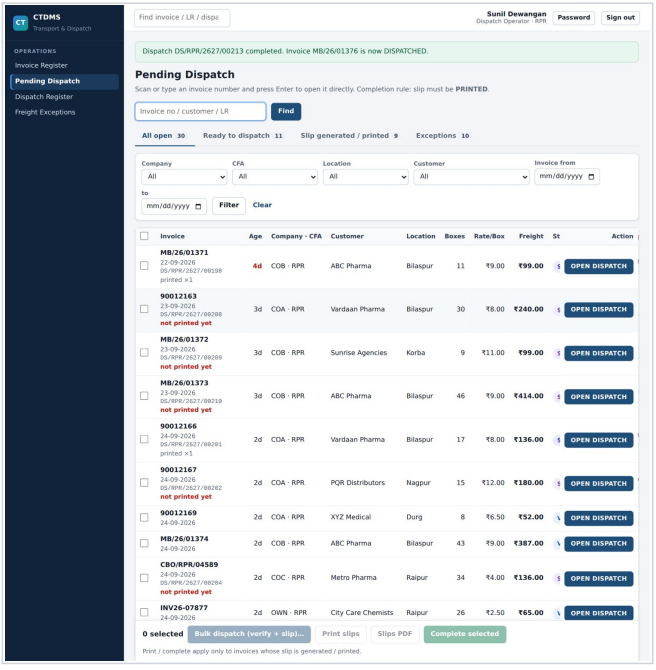

Dispatch details filled in

Slip generated - details locked, Print enabled

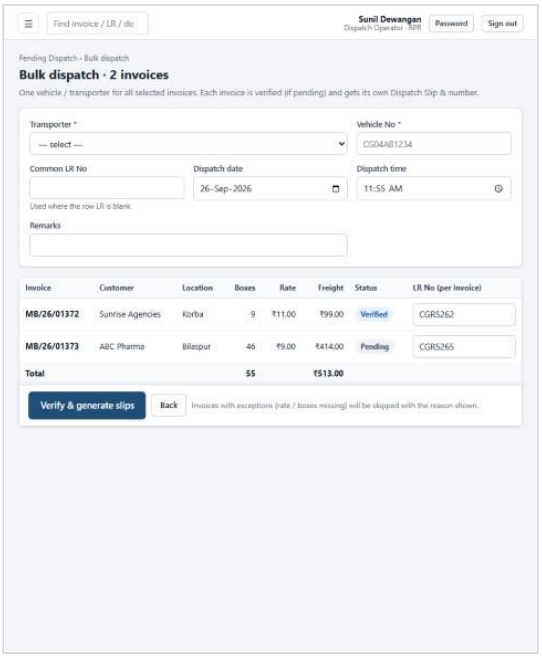

Printed slip (A5, ORIGINAL)

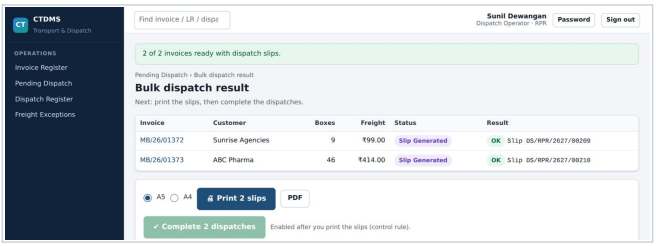

Completed - invoice is DISPATCHED

2.6 Bulk dispatch (one truck, many invoices)

1. In Pending Dispatch tick the invoices (Ready tab) › **Bulk dispatch (verify + slip)**.
2. Enter the transporter, vehicle and (optionally) one LR for all, or one LR per invoice › **Verify & generate slips**. Invoices with problems are skipped with the reason.
3. On the result page click **Print N slips** - this unlocks **Complete N dispatches**.

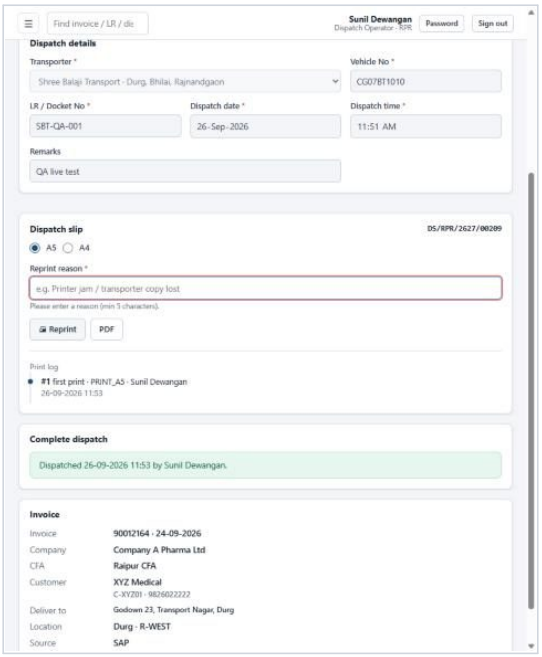

Bulk entry (live)

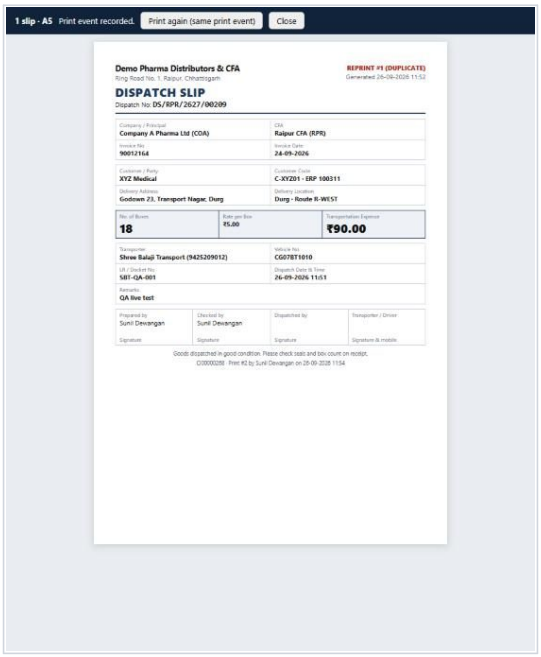

Result page v1.1

2.7 Reprint, void and cancel

- **Reprint:** dispatch page › Dispatch slip › type a reason (5+ characters) › Reprint. The copy is marked 'REPRINT #n (DUPLICATE)' and logged.
- **Void slip** (checker / CFA manager): More actions › reason › Void slip. Details unlock; a new number is issued on the next generate.
- **Cancel dispatch:** for an invoice cancelled in the ERP. Completed dispatches can only be cancelled by an administrator.

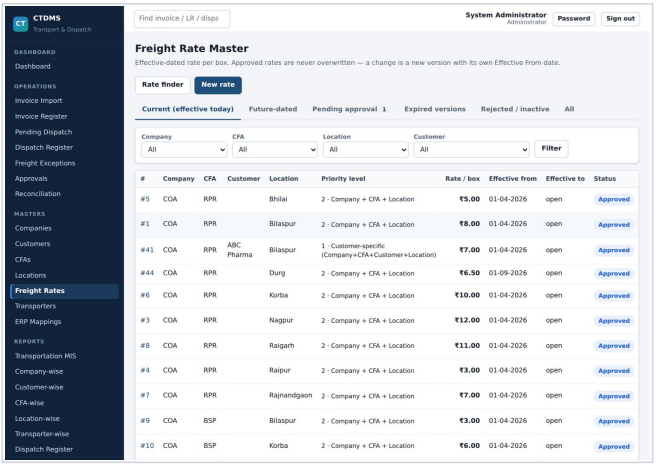

Reprint needs a reason (live)

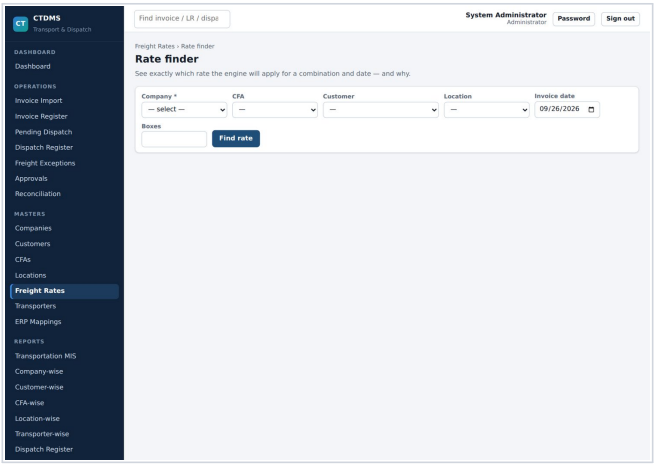

Duplicate copy (live)

2.8 Freight rates, exceptions and approvals

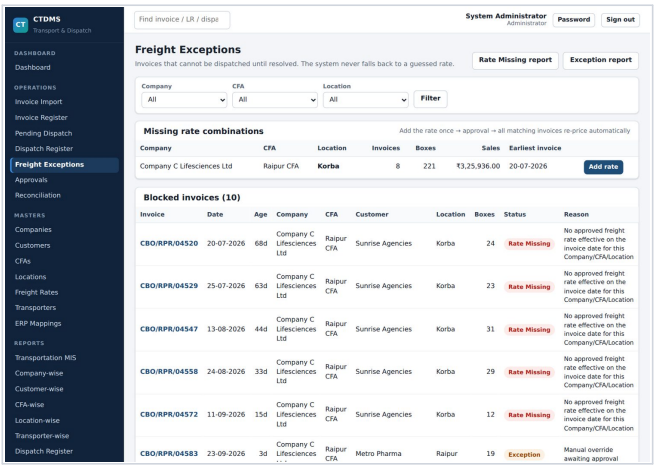

- **Masters › Freight Rates.** A rate is per box for Company + (CFA) + (Customer) + Location, from a date. Most specific wins: Customer › CFA + Location › Location › Company default.
- New or revised rates wait for a **checker**; the creator cannot approve their own. Approving a revision end-dates the previous version automatically; old invoices keep the rate they were priced with.
- **Rate finder** shows which rate an invoice would get and why. **Freight Exceptions** lists invoices blocked by a missing rate or boxes - add the rate and they re-price automatically.
- **Approvals** (checker): manual box / rate changes, rate changes and transporter bills in one queue. Rejecting needs a remark.

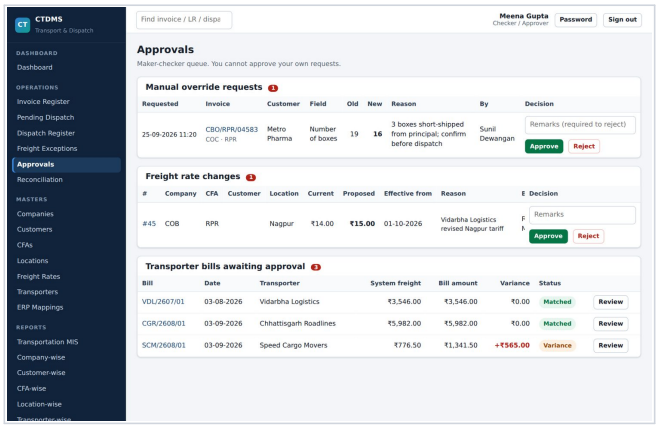

Rate list

Rate finder

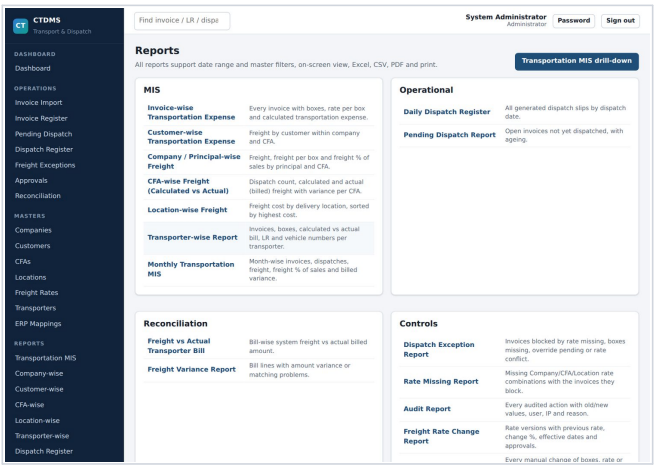

Freight exceptions

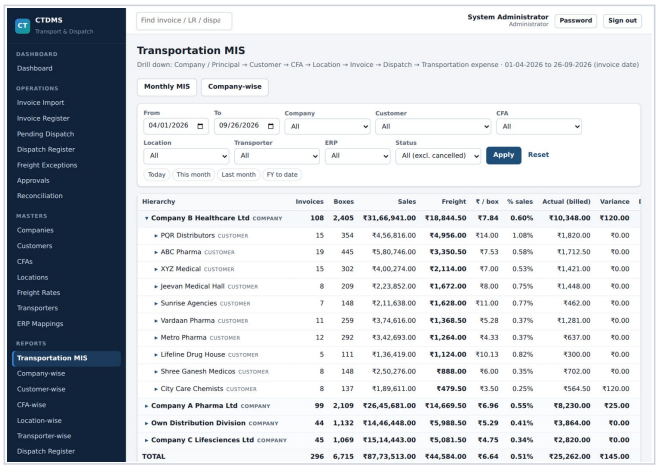

Approvals queue

2.9 Reports and MIS

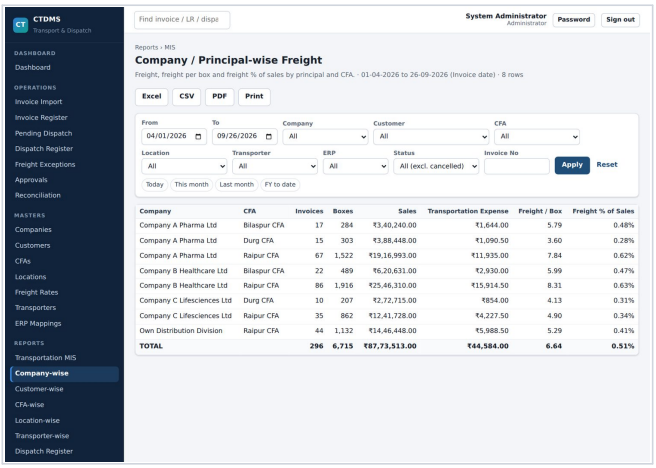

- **Reports** menu: invoice-wise, customer-wise, company-wise, CFA-wise, location-wise, transporter-wise, monthly MIS, dispatch register, pending dispatch, variance, rate changes, overrides, reprints, audit.
- Every report has date and master filters, and Excel / CSV / PDF / Print buttons (hidden for roles without export rights).
- **Transportation MIS** drills down Company › Customer › CFA › Location › Invoice with totals at each level.

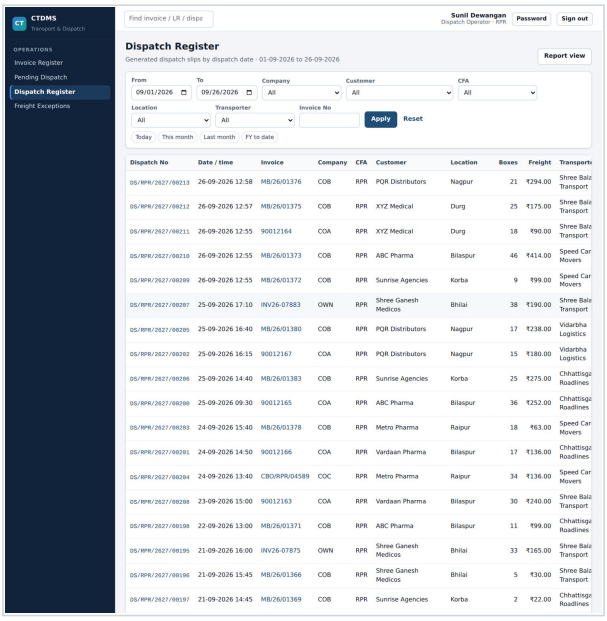

Reports list

MIS drill-down

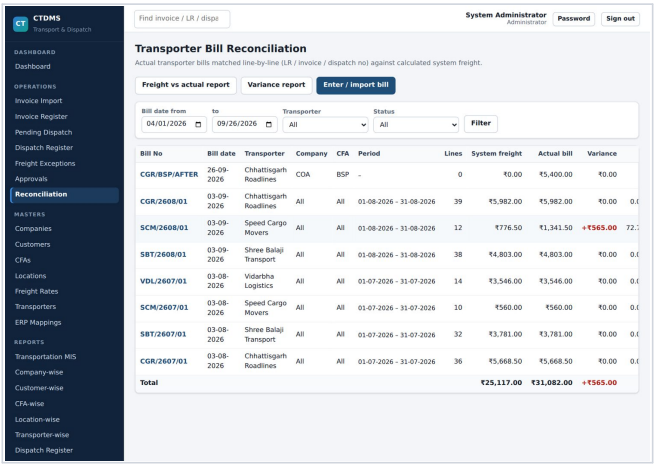

Company-wise freight

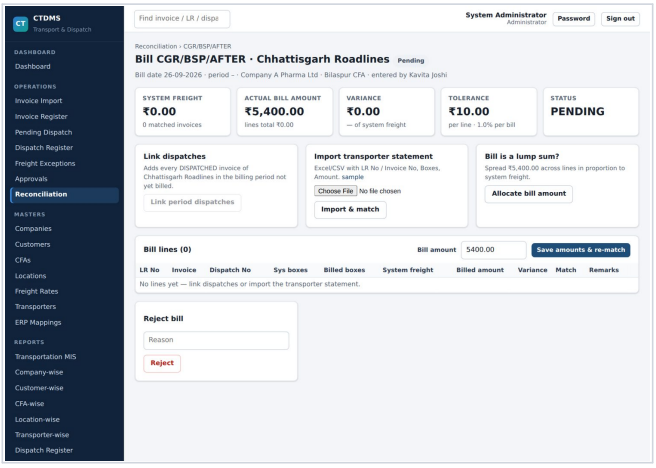

Dispatch register

2.10 Transporter bills (accounts)

1. **Reconciliation › New bill:** transporter, bill no, date, amount, company / CFA, billing period; tick 'link dispatches' to pull that transporter's dispatches for the period.
2. Enter billed amounts per line (or import the transporter's statement / allocate the total). Lines are matched: Matched, Variance, Not found, Not dispatched, Other transporter, Duplicate.
3. Remove or correct problem lines. Another person (not the one who entered or edited the amounts) approves; variance needs a remark. Then **Mark paid** with the UTR / cheque number.

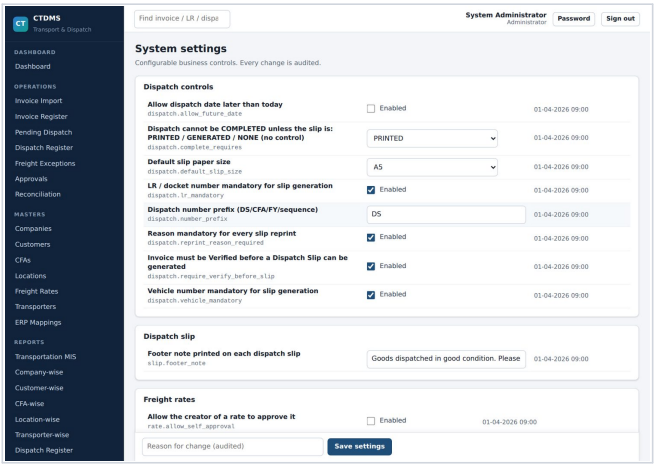

Bill list

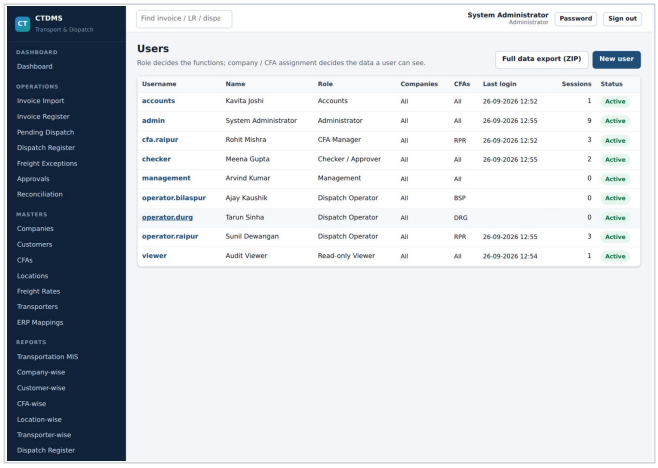

Bill detail

2.11 Administration

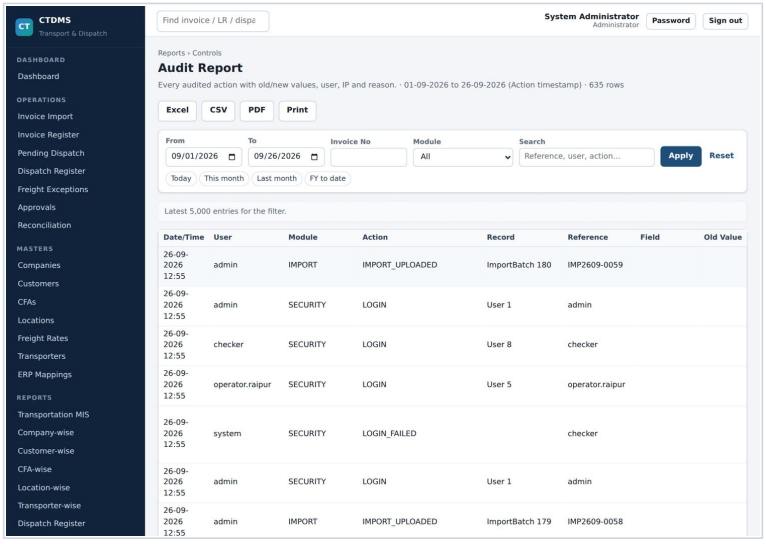

- **Users:** create users, assign a role and the companies / CFAs they may see; Reset & unlock after a lock-out.
- **System Settings:** dispatch rules (print before complete, vehicle / LR mandatory, future dates, reprint reason), slip size and footer, rate approval, reconciliation tolerance. Every change asks for a reason and is audited.
- **Audit Log:** every change with old / new value, user, time, IP and reason. **Integration Settings:** ERP adapters, API keys, sync runs.
